Resolv

The AI teammate that finishes the support case, not just the conversation.

Problem statement
Design an AI teammate that goes beyond answering questions to deliver measurable outcomes in sales or customer service.

[Team Name] Team ID [Team ID]

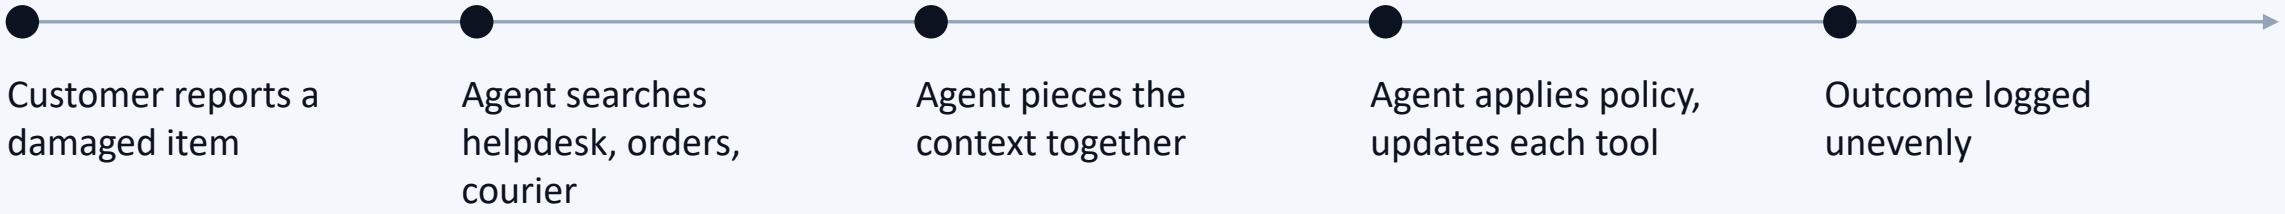

[Member 1] · [Member 2] · [Member 3] · [Member 4] · [Member 5] · [Member 6]

Illustrative concept, not a built screen

Answering is quick. Finishing the case is still manual.

A damaged-item case today

Pain point		What it costs the team
Context is split across tools	→	Longer handling; customers repeat themselves
Bots answer but don't act	→	The work is left unfinished
Actions aren't checked	→	Errors and rework
Follow-ups live in memory	→	Cases reopen; repeat sales are lost

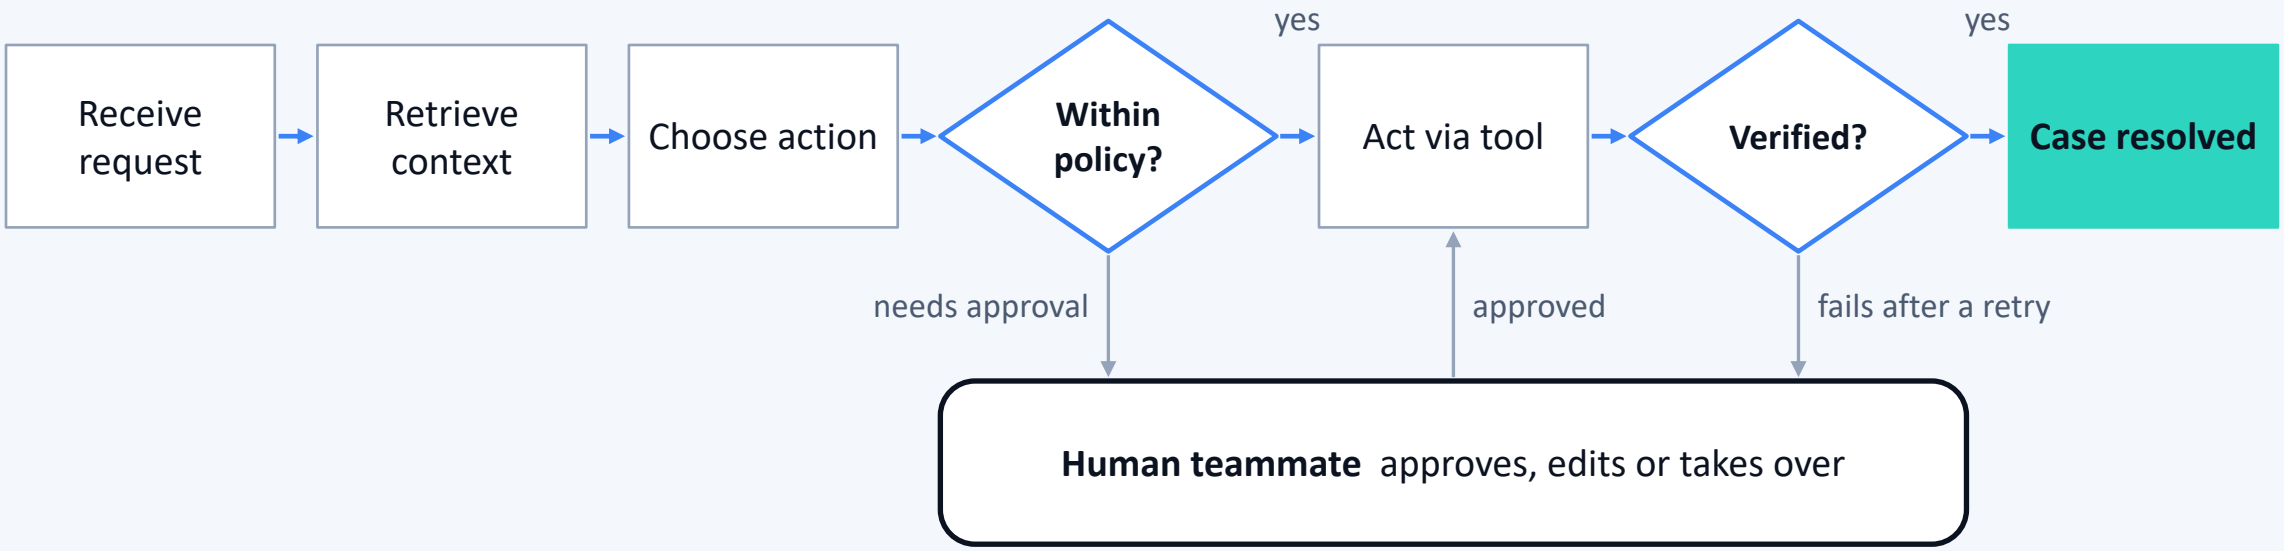

The gap isn't the answer. It's **completing the next action**, checking it worked, and knowing when to bring in a person.

Chatbot answers, suggests

AI teammate understands, decides, acts, verifies, escalates

Pain points are hypotheses for small and mid-size e-commerce support teams, to be checked in user interviews. No external statistics are claimed.

Resolv finishes the case, and asks a human when it should.

Human decisions and verified outcomes are added to the test set.

Example *illustrative*

Customer
"My blender jar arrived cracked."

Resolv acts
Creates a replacement within the auto-approve limit

Resolv checks
Order API returns a new order ID; ticket updated

What's different

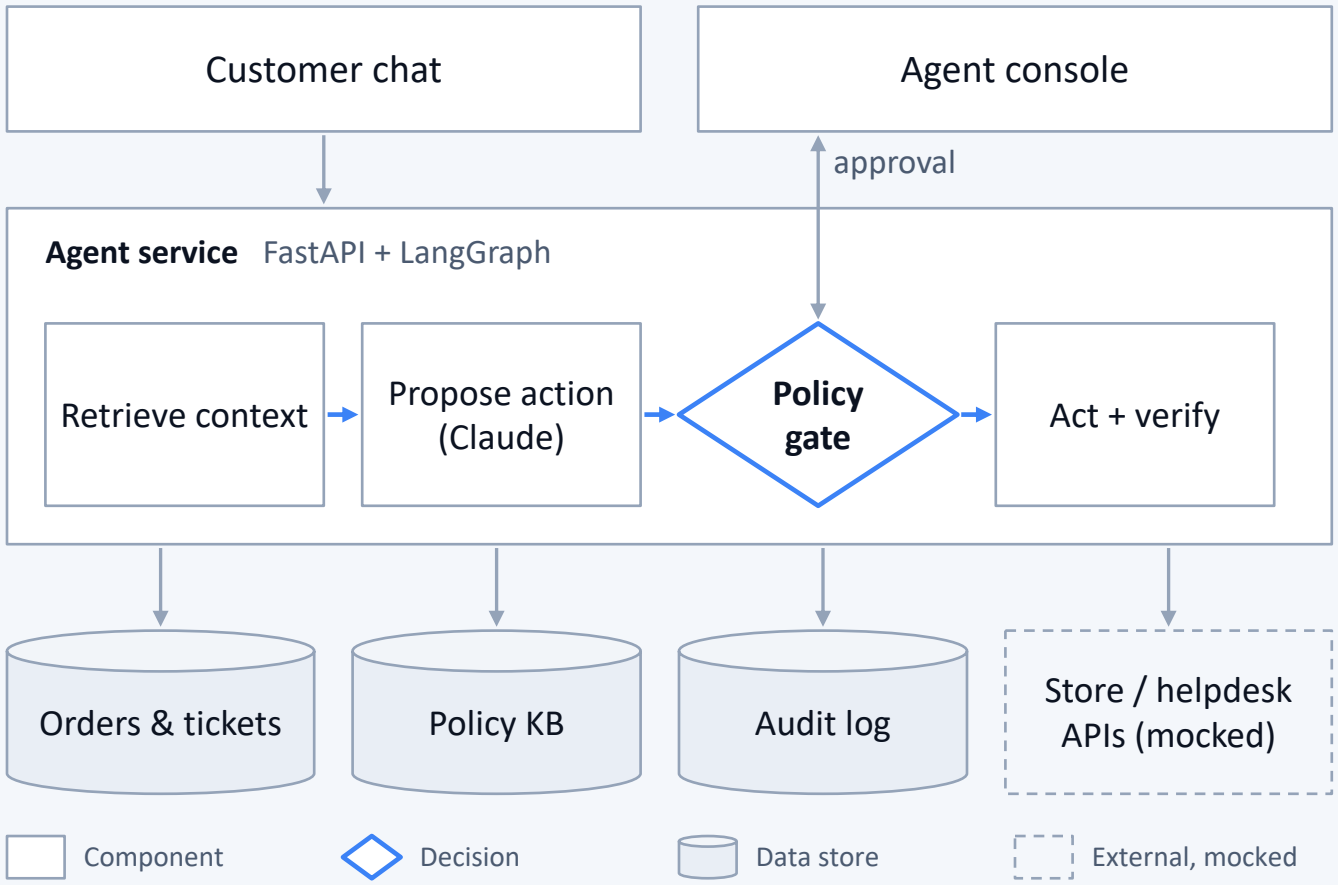

Completes the action, not just the reply

Grounded in order and policy data

Every action checked and logged

Human approval built in

The model proposes. Rules and tools decide what happens.

Layer	Technology	Status
Interface	React + TypeScript	Proposed
Agent service	FastAPI, Python 3.11	Proposed
Agent loop	LangGraph	Proposed
Model	Claude Sonnet 5.5	Proposed
Data + audit	PostgreSQL + pgvector	Proposed
Store / helpdesk	Mock APIs	*Mocked*
Auth	OAuth2 + roles	*Planned*
Testing	pytest scenarios	Proposed
Deploy	Docker Compose	Proposed

Proposed: in the MVP plan, not yet built. Mocked: simulated for the demo. Planned: pilot or later. Nothing is implemented yet.

Agent loop follows ReAct (Yao et al., 2022, arXiv:2210.03629) and Toolformer (Schick et al., 2023, arXiv:2302.04761).

Who gains, and how we'll know.

Support agents

Fewer lookups and repeated updates; more time for hard cases.

via context retrieval and tool actions

Customers

A fix that's actually done, with proof, without repeating the story.

via verified actions and notifications

Managers and owners

See what was resolved, escalated or failed, inside set limits.

via audit log, policy gate, roles

Method: run a scripted case set with today's process, then the same set with Resolv, and compare from the audit log.

Pilot metrics

Proposed, not yet measured

Task completion rate
cases closed by a verified action

Resolution time
first message to verified outcome

First-contact resolution
no repeat contact needed

Escalation rate
share sent to an agent, with reason

Action success rate
actions that pass their check

Record accuracy
fields correct on an audit sample

Start narrow, prove the outcome, then scale.

MVP
Damaged and missing items, on mock store APIs

Pilot
One brand's helpdesk, measured against a baseline

Production
SSO, roles, retries and monitoring

Scale
Multi-tenant SaaS and more workflows

Go-to-market D2C e-commerce brands first → controlled pilot → measured ROI → more workflows

Revenue model hypothesis; pricing not yet validated

Subscription	by agent seats and monthly case volume
Per verified resolution	charged only when an action passes its check
Onboarding	paid store and helpdesk setup
Enterprise	private deployment, governance, support

Next, by theme

Channels
WhatsApp, email, voice

Integrations
Shopify, Zendesk, Freshdesk

Reach
Hindi and regional languages; sales follow-ups
